INTERPRETATION(S)
Specific Findings: xrays demonstrating severe degenerative joint disease with joint space narrowing, subchondral sclerosis, osteophyte formation

Impression/Plan:
1. Knee Osteoarthritis, Left
   Unilateral primary osteoarthritis, left knee (M17.12)

Plan: Counseling - Preoperative Instructions.
Please refer to the education handout for detailed counseling.

Plan: Counseling - Knee DJD.
Musculoskeletal care: I advised the patient that most patients with degenerative joint disease of the knee can achieve some measure of pain relief from nonsurgical options like medications, lifestyle modification, exercise and physical therapy, and use of supportive devices or change in footwear. The importance of maintaining an ideal body weight or losing weight to reduce stress on the knee joint is a cornestone of nonoperative management.

Surgical Options and Alternatives
Total knee replacement : I explained to the patient that this is an option for patients that have severe pain in their knee from arthritis who have failed conservative management. The diseased parts of the knee are replaced with metal and plastic. Approximately 90% of patients who have total knee replacement experience a significant reduction in pain and a dramatic improvement in their ability to perform common activities of daily living. High impact activities should be avoided after surgery, if possible, to prolong the life of the implant. Serious complications occur in less than 2% of patients. Risks include but are not limited to infection, injury to blood vessels and nerves, blood clots, heart complications, lung complications, stroke, and stiffness.

Associated with:
Order Plain X-ray/Interpretation

Follow up. Other Instructions: Post-op visit 10-14 dates after surgery date
